

Household Appliances

During the green procurement of household appliances for offices, schools etc., a contribution to the preservation of resources and a reducing of the operating cost could be achieved by taking into consideration energy efficiency and environmental criteria. Additional criteria may be also considered in order to prevent the impact of the manufacturing process and the use phase on the environment.

Good practice examples involving the purchase of household appliances by public administrations and enterprises have been collected for the Buy Smart project, to support further green procurement actions for this product group by showing how energy efficiency and environmental criteria have been integrated in successful tenders in the participating countries.
